

Solution Requirements

Project Information & Functional Requirements

Date: 30 September 2026

Team ID: SWTID-2026-9157

Project Name: Cricket Player Performance Tracking Application (CRICKSTATS)

Maximum Marks: 4 Marks

Definition

Functional requirements describe what the CRICKSTATS system should do. Non-functional requirements describe how well the system should perform.

S.No	Requirement Category	Requirement Description	Priority
1	Authentication	Users securely log in through Salesforce authentication and only authenticated users can access CRICKSTATS.	High
2	Authorization levels	Define roles/permissions for Team Lead and team members. Access to Player, Match Performance, flows, reports and configuration is controlled by Salesforce permissions.	High
3	External interfaces	The application operates within Salesforce Lightning. No external API is required for the core project; Salesforce services provide the application interface and data platform.	Medium
4	Transactions processing	Create, update and relate Player and Match Performance records. Data entered through forms/flows is validated and saved to Salesforce.	High
5	Reporting	Provide dashboards/reports for player statistics and match performance, with roll-up summaries for relevant player-level totals/metrics.	High
6	Business rules, etc.	Maintain valid relationships between players and match performances; required fields must be completed; performance data must follow defined field formats and project rules.	High
7	Compliance to laws or regulations	Protect user and player data using Salesforce access controls and privacy/security practices. Only necessary project data should be stored and exposed to authorized users.	Medium
8	Other	Provide Custom Tabs, Lightning App, Screen Flow and Home Page Flow for simple navigation, data entry and an interactive user experience.	High

Functional Requirements — Implementation Details

CRICKSTATS is a Salesforce-based Cricket Player Performance Tracking Application. The following details explain how the functional requirements are implemented using the project components.

Component	Purpose / Requirement Fulfilled	Responsible Member
Player Object	Stores player-related records and details required by the application.	Alina Harmin Z
Match Performance Object	Stores match-level performance records and links them to players.	Alina Harmin Z
Custom Fields	Custom fields capture the required player and match-performance details.	Afeefa Thasneem F
Custom Tabs	Provides navigation to the relevant records and objects.	Humyra Saimah K
Lightning App	Combines the project components into a user-facing Salesforce application.	Humyra Saimah K
Screen Flow	Guides users through an interactive process for entering or handling application data.	Ifra Sameen
Home Page Flow	Makes the home page interactive and provides an accessible flow entry point.	Ifra Sameen
Roll-Up Summary	Aggregates relevant child Match Performance information at the Player level where supported by the Salesforce relationship design.	Aysha Malhan
Coordination & Integration	Ensures objects, fields, tabs, app, flows and summaries work together as one solution.	Aysha Malhan

Functional acceptance checklist

- Authenticated users can open the CRICKSTATS Lightning App.
- Player and Match Performance objects are available with the required custom fields.
- Users can create and maintain match-performance information.
- Screen Flow and Home Page Flow are accessible and functional.
- Custom Tabs provide navigation to the main application components.
- Roll-up summary calculations display the intended aggregated player information.
- Reports/dashboards provide useful player-performance information.

Solution Requirements

Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	The Lightning App, record pages and flows should respond promptly for normal project-sized datasets.	Target: common page/record actions should load within ~2–3 seconds under normal conditions; flow steps should advance promptly.
2	Scalability	The solution should use Salesforce standard/custom objects and relationships so that additional players and match-performance records can be added without redesigning the application.	Target: support continued growth of project data within Salesforce platform/object limits and configured org limits.
3	Security & Data Privacy	Use Salesforce authentication, profiles/permission sets, object/field permissions and sharing controls to restrict access to authorized users.	Acceptance: unauthorized users cannot access restricted records/fields; data is protected by Salesforce platform security.
4	Reliability & Availability	The application should depend on Salesforce platform services and avoid unnecessary external dependencies.	Target: available whenever the Salesforce environment is available; flows and core records should not depend on a separate third-party service.
5	Usability & Accessibility	Use clear labels, logical navigation, simple flows and consistent Lightning components so users can understand and operate the application easily.	Acceptance: a user can navigate the app, enter performance data and view results without specialized technical knowledge.
6	Other — Maintainability	Use clear object/field names, modular flows and standard Salesforce configuration wherever practical so the solution can be maintained by the team.	Acceptance: project members can identify and update individual objects, fields, tabs, flows and summaries without changing unrelated components.

Project Team

Role	Team Member	Assigned Work
Team Lead	Aysha Malhan	Roll-Up Summary; coordination and integration
Member	Alina Harmin Z	Player Object; Match Performance Object
Member	Humyra Saimah K	Custom Tabs; Lightning App
Member	Afeefa Thasneem F	Custom Fields for Player and Match Performance
Member	Ifra Sameen	Screen Flow; Home Page Flow
